Article published on January 24th 2012 | Software

The concept of custom software development has transformed the IT world to a great extent. There has been an advent of new concepts and technological tools while drastic progress has been made in the mobile application development field. Most companies in the western world, including the Fortune 500 companies realize the benefits of custom software development services offered by companies in the east. Every firm has a set of requirements related to its non-core tasks for which they have to allocate resources in-house. It is cost-effective for such companies to outsource the resources to some offshore provider who is efficient in handling those tasks. In the IT world, one can find low cost developers and engineers in the eastern part of the world which is beneficial for clients in the east.

On the flipside, there have been many offshore software development service providers who were responsible for failed projects but that was when outsourcing was in a nascent stage. Companies today are better equipped with resources and have a clear understand of what the client demands would be.

The virtual worker outsourcing process requires the offshore software team to collaborate with the clientâ€™s technical lead and offer the best solution to their problems. Sometimes the client is clear about what he or she wants.

The offshore software development companies go about their development and maintenance services in accordance to the SDLC (software development lifecycle). The process includes budgeting, necessary approvals from the management, and quality services all within a specified and mutually agreed upon timeframe. Companies in US and UK have benefitted the most due to the offshore software development process and have reaped a sizeable amount of revenue.

It is advisable to find a software development company who has a sizeable team of expert developers and engineers who have experience in working with multiple domains and industries. This reduces the preliminary effort required for making the vendors understand the need. The requirement study phase is important to gauge the profitability and scope of a project. Additionally companies need to venture out for vendors who are willing to opt for flexible engagement models as the needs and requirements arise.

Requirements must be defined succinctly to prevent further confusion. Tasks need to be assigned in simple and clear manner and the period for the completion of the project should be framed reasonably. Both the client and the offshore software services provider should be aware of the terms and conditions of the project.
