How to Speed Up Windows 7 by [Hennary Joe](#)

Article published on December 6th 2011 | [Software](#)

Windows 7 is the most successful operating system so far by Microsoft. Windows 7 may be the quickest and also the most responsive Microsoft Operating system up to now, but that does not necessarily mean it is proof against slow-computer issue that begin happening following several weeks of intensive usage. So whichever customization of Windows 7 you have, it's going to get muddled and initiate reducing the performance. Thankfully you can find safe methods to accelerate computer running Windows 7 without needing to get a hold of any software program or using harmful computer registry hacks. We're going to deal with these now in the following below sections.

Remove rarely used applications and Windows features

When you are getting a new Computer system or laptop, many times, it arrives with a lot of pre-installed try-and-buy applications. Many people never ever utilize these applications; so that it is better to un-install them. Also if you want testing out new software program and download various programs frequently, it is best if you take a look at installed software program checklist and do away with everything it's not necessary. This way you can release some resources and increase Windows 7 startup time. To achieve that go to Control Panel -> Programs -> Uninstall a program and eliminate all you do not use.

Exact same applies to abandoned Windows 7 functions - go to Control Panel -> Programs -> Turn Windows features off or on and uncheck the characteristics it's not necessary.

This really is an additional suggestion regarding how to speed up your computer operating any Windows version.

Use ReadyBoost

ReadyBoost is really a characteristic which was very first unveiled in Microsoft windows Vista and made its way into Windows 7. Fundamentally, it allows you to make use of a Usb memory card as secondary storage cache, which will help your laptop or computer to perform quicker. Take into account that it is no replacement for Random access memory, although. ReadyBoost is certainly a substitute to speed up your slow computer.

To make use of ReadyBoost, just inset a Usb memory card and when it fulfills the necessities, Windows 7 asks you if you wish to apply it ReadyBoost and advise the size to reserve.

When you put the usb flash drive and absolutely nothing occurs, it would mean that AutoPlay is disabled. In this instance do the following steps:

Go to Computer, right-click to the removable storage device and choose Properties.

In case the drive is appropriate, you will notice ReadyBoost there. Click it.

Choose Use this device and set the amount of space to be utilized for ReadyBoost system file.

Click OK.

Take a look at start-up list

Having a lot of start-up things is easily the most frequent reason for computer system slow-downs. Some programs behave that you cannot do without them making on their own load each and every time your pc begins. This way each time your computer loads each one of these applications load in addition, even though you do not rely on them that regularly. As a result, your Windows gets a lot more slowly. The answer will be to turn off the option for such programs to begin quickly. You can do this possibly through the program menu, or by using the System Configuration utility. This tweak can speed up your slow startup/ slow computer issue immediately.

Just type msconfig in the Start menu search box, hit Enter, when the system configuration utility opens, then navigate to the Start-up tab and turn off the items there is no need. Similar to the prior suggestion, this works on all Windows versions.
