Htmlangels converts PSD to XHTML in a Synch by Mike Nielson

Article published on January 16th 2012 | Software

In previous articles the work of website creator near resembles that of building construction. Let us do another one here using PSD to XHTML conversion.

XHTML is an advanced version of HTML where in built user defined tags are in use to develop fully featured web applications. It does sound like building service systems in building construction. These are the system that makes a building livable; electric power, water supply, heating and air-conditioning systems.

The XHTML can help create more complex websites thus; one of its main purposes is to make a website even more attractive and interesting. Building service systems makes the edifice more comfortable and convenient to the inhabitant.

The end product of converting PSD to XHTML is a more advanced and versatile website that can support a wider variety of formats. To enable the website creator to do this, he must obtain the latest PSD converter program to XHTML and have the qualified personnel to operate the program. The civil contractor likewise can not rely on existing personnel and equipments to do building service system works. The tools and equipment of electricians, HVAC technicians and plumbers are very specialized and each one is used only for a specific purpose. In the same manner that a contractor can not ask the carpenter to connect and install a transformer neither can the engineer have the carpenter flush the refrigerant lines, nor have a painter install the water closet. Similarly not everyone in the website creation business is knowledgeable in the operation on how to convert PSD to XHTML.

There is a saying that â€œyou will have monkeys working for you if you pay peanutsâ€•. The same is true with website creation and building construction. A company that operates the latest programs in computer technology and employs the best people in the business should not be compared to a college kid doing some computer work to earn a buck. In the same manner it is not right to measure the rate of a contractor employing hundreds of people and in possession of tools and equipments worth millions with the rate of a carpenter with just a mere hammer and saw.

It is very scarce to see a building contractor capable of also doing building service systems work. Usually, it is a separate contract with what construction calls allied services. The civil contractor concentrates on foundation and finishing works. Electrical contractors, HVAC contractors and plumbers are three different parties that would have to coordinate with civil works. I think the comparison ends there because I know for a fact that Htmlangels is capable of doing all sorts of conversion of PSD to XHTML in a synch for web site construction. If you are prudent, get their services. They are worth it.
