Need of Virtualization in an Organization

by Rehan Khan

Article published on February 22nd 2012 | Software

Virtualization in simple terms means running several operating systems on one server computer. With the help of the virtualization software, a computer can run several operating systems concurrently allowing each system access to its hardware components like the CPU, RAM, etc. There is also a server line of products, aimed at allowing people to run large numbers of operating systems on a single physical machine, one version of which provides its own base operating system. Essentially, this allows you to run multiple Intel-based operating systems on a single physical machine.

Your infrastructure might be a complex ecosystem with different servers, operating systems and applications interacting with a wide variety of desktops. Managing and supporting this assortment of mission-critical technology can be a little more complicated and time consuming. There are many companies that can assist you in deploying server or desktop virtualization to reduce cost, optimize business network infrastructure, increase hardware utilization, speed up routine task, scale as needed. Deploying virtualization technology is a popular and cost-effective way to deal with this challenge and they are here to assist you.

Benefits Of Virtualization:-

Isolation: Virtual machines are completely isolated from both the host machine and other virtual machines. If a virtual machine crashes it does not affect others. Data does not leak across virtual machines and applications can communicate over configured network connections.

Partitioning: Multiple applications and operating systems can be supported in a single physical system. Servers can be consolidated into virtual machines on either in two scale architecture i.e. scale-up & scale-out. Computing resources are treated as a uniform pool that can be allocated to virtual machines in a controlled manner.

Encapsulation: Complete virtual machine environment is saved as a single file which is easy to back up, move and copy; standardized virtualized hardware is presented to the application guaranteeing compatibility.

A virtualization solution is offering a tremendous business advantage to individuals and their businesses. Rather than using an increasing amount of storage space, businesses are efficiently condensing their information architecture in a way that is easier to manage and far more cost-effective.

Many companies specialize in providing managed IT services, computer hardware, software, backup solutions, networking, wireless, IT security, cloud services, virtualization, multifunction Xerox copier, printers & managed print services Miami and Fort Lauderdale. They partner with leading technology companies to offer you with the best available technology. They always work in close collaboration with their clients to truly understand the business and goals of the mission. Their approach is to design, build, implement and manage solutions that measurably improve their clientâ€™s organizations to become more productive and profitable.
