Using Software: Important Legal Considerations by Samantha Cole

Article published on April 20th 2012 | Software

Worldwide software piracy rate registered at 43% in 2009, according to the Business Software Alliance. In the same year, an additional $75 worth of unlicensed software permeated the market for every $100 of genuine software purchased. Since this increase is quite worrying, consumers are urged to be careful when purchasing software. One thing they must always verify is the software's license.

Software is an intellectual property that calls for the individual to first get a license before s/he can utilize it. Thankfully, any software gotten by a user or a company comes with a license-except if it's a freeware. This indicates that all buyers of a certain software immediately get permission from the producer to utilize the program. Furthermore, the code and agreement integrated in the software, called End User Licensee Agreement (EULA), clarifies precisely how the software can be utilized. Only by agreeing to these conditions and terms can the user successfully set up the program.

There are two standard types of software licenses: multiuser and single user. A single user license allows usage of software for small businesses like those that rely on laptops or small-scale companies. On the other hand, a multiuser license permits a larger number of users to access and utilize the software. This is suitable for businesses that should offer their staff members with access to the same software.

If a software is classified as a freeware, it implies that it can be utilized and downloaded free of charge. Conversely, if it is a shareware, it implies that the software is copyrighted but still free of charge for download and usage. Although both kinds seem attractive because they are free, they can be disadvantageous in some ways. For example, they may have restricted features and will expire after some period. If customers intend to continue utilizing a specific software such as the Blackberry Enterprise Server, the manufacturer may require payment from them.

With the increasing demand for authentic phone and computer software, many businesses began providing such programs at competitive prices. Additionally, if a business or a user requires one or several units of the Blackberry Enterprise Server software, the companies can ship what is required within a few days.

In addition to competitive rates, suppliers of Blackberry Enterprise Sever and other programs also provide approval comparable to that of the manufacturer. When individuals would like to purchase the software for a large operation, the company can deliver as many licenses as the buyer wants-even for 100 or more models.
