Website Application Development using PHP frameworks by Virtueinfo Web Technologies

Article published on January 11th 2012 | Software

PHP is a programming language usually designed for web development for server side programming to make dynamic web pages. The PHP code is fixed in the HTML code document and interpreted by a web server with a PHP processor module that generates the web page document. It has also evolved to include a command line interface of supply and can be used for graphics applications.

PHP language was developed by Rasmus Lerdorf in early 1995. Before, it was known as Personal Home Page before PHP version 3.0 came. There were too many bugs and errors which were fixed in new versions.

PHP programming language allows developers to write extensions in C to append functionality to PHP. These can be compiled into PHP or dynamically loaded at runtime. Extensions have been written to add support for the Windows API, process management on Unix-like operating systems, Unicode, curl, and several popular compression formats. a number of of the more unusual features include integration with Internet relay chat, dynamic generation of images and Flash content, and even speech synthesis. The PHP Extension Community Library (PECL) project is a repository of extensions for PHP.

PHP is open source scripting programming language that offers plenty of tools to web developers and programmers for the best web application development. Today, PHP is the scripting language for dynamic website the best as it can be used between the HTML code for database connectivity and MYSQL databases used PgSQL. The first version of PHP was driven by ZendEngine was introduced version and version 5, such as OOPs (Object Oriented Programs). PHP version 6 allows Unicode or multi byte strings.

PHP web development and application development in PHP, in all cases, PHP scripting language is used.
