3D Laser Mapping Videos Lend a Helping Hand by James Blee

Article published on May 3rd 2012 | Technology

Have you ever imagined how does the 3D laser mapping video occupy such a special place in the surveying field? The answer to this simple question lies elsewhere. For instance, there are many engineering and construction companies that prefer making use this kind of videos. This preference of such videos stems from the fact that they have numerous fantastic features and advantages over traditional surveying methods.

The greatest advantage that 3d laser mapping offers to these users can be seen in the improved quality that their projects end up with. These projects do get recognition from the experts of the industry for their conceptual and technical greatness.

It is a common knowledge that the laser mapping survey results provide much needed assistance when they are seen in video format. The data collected with help of survey finds a better way of expression. As a result, the organizations and companies connected with the survey are in a better position to draw their own conclusions.

In cases where laser mapping technical is not used and instead the traditional surveying methods are put to use, it becomes a time consuming affair. This explains why this laser mapping form is preferred by the users of this technique. There are many areas where these imaging videos play an indispensable role. Moreover the data collected in the process is of superior quality by which the real motive of conducting these surveys is achieved.

Mechanical engineering is the most important area where this form of technique is routinely applied. In cases where the traditional surveying methods are put to use, the date that is yielded is not so quick. Rather, this is mostly based on trial and error method which has the inherent defect of being too tedious and cumbersome. Under these processes, mechanical synchronization becomes relatively very easy. This is one reason that has led to a wide use of this form of surveying method.
