Article published on March 5th 2012 | Technology

A photo impact printer is a brand new generation printer which replaced the dot-matrix printer as well as the daisy wheel printer. Its working is simple and we could say it works by creating an impact on the paper with the printer ink released by a cartridge. The ink hits on the paper and therefore forms the printing process. The photo impact printer inks the hammer by dipping it into the cartridge and then applies it on the paper that is gone in.

It has eliminated the drawbacks of dot matrix printer which is simply used to print in a single color which only included printing of simple text. This new innovation helps us print pictures as well as text in various colors. This is possible because it functions on a cartridge system and not by the ribbon method.

Nowadays, a photo impact printer possesses built in software to edit, resize or perhaps the caption an image. We can add logos and symbols and make fake watermarks on the photo which may look actual. Photo impact printers usually do not necessarily just print on paper; and therefore are used to print t-shirts, make imprints on jewelry, vehicles, musical instruments, plastic mugs, etc.

There are numerous makers of this kind of printers which include Hewlett Packard, Canon, and Epson among others. They are affordable, compact and user-friendly. On the down side, these printers use a great deal of ink, which is expensive because of the non-erasable property in them. These types of printers require constant maintenance and tuning up otherwise, they might stop working very soon. Maintenance is the top disadvantage despite many attractive features. Thus, photo impact printers are crucial machines used by man in this particular modern world and are likely to affect of lives either way.
