Article published on January 19th 2012 | Technology

This topic is all over the news. Perhaps, people have realized that this initiative can literally revolutionize the telecommunication industry. Some leading telecom companies have taken come up with VoLTE-equipped devices. However, they are yet to enter the market with their offerings. If experts are to be believed, this technology would definitely spark a flurry of interest in the years to come. They suggest that this technology can do wonders for the end-users, if the companies deal with the following issues on an urgent basis:

â€¢People often associate LTE with poor customer experience. Therefore, they have a lot of apprehensions. It is ifficult to popularize Voice over LTE under these circumstances. However, techies are trying to find out a solution to this problem.

â€¢It is often said that the implementation of this industry initiative would require a lot of input. For instance, some new solutions would be required for voice as well as SMS. Lately, the concept of 'one voice' has been all over the news.

â€¢Dean Bubley recently said, "What operator will want to invest in more expensive technology in order to provide a worse service in a declining market?" This technology is often associated with a huge investment. Therefore, unless the experts come up with some economically viable solutions.

â€¢People who are well-versed with the nuances of Voice over LTE are often seen talking about the 'migratory solutions'. However, it is really difficult to remove these solutions once they become an integral part of a network. It is obvious that the service providers need to take care of this problem at the earliest.

This technology looks quite promising. It would bring along a lot of benefits. Some of these benefits are as follows:

â€¢GSMA VoLTE (an initiative that was announced almost 2 years back) would ensure that roaming capability is maintained.

â€¢Any service provider that will put Voice over LTE into practice would ensure that all its data and voice services are delivered over the same network. Needless to say, this would be really beneficial for the end-users.

â€¢Some experts have gone to the extent of claiming that this technology would facilitate easy roaming. It would surely cause a stir.

â€¢It is also being said that this technology would not require the support of a legacy infrastructure.

â€¢Handset availability would also receive a much-deserved boost.
