Benefits of Electronic Cigarettes by Shala Ohms

Article published on March 23rd 2012 | Technology

Sometimes, no amount of disturbing evidence is convincing enough to make chain-smokers stop smoking. Some people fail to stop their smoking addition even in their greatest attempts. The world today suffers from too much carbon release and smokers add to this by puffing a stick.

Fortunately, technology has been resourceful and efficient to address problems associated with smoking. Instead of persuading smokers to stop smoking, why not introduce an alternative to them instead? Electronic cigarettes or e-cigars are smokeless cigars free from carcinogenic properties. They were invented in China in 2004 and were introduced as a â€œruyanâ€• or â€œalmost like smokeâ€• With its wide success, the United Kingdom, calling E-cigars â€œelectronic fagsâ€•, created a market for these products.

The E-cigarâ€™s success has prompted many countries around the world to market the device as beneficial rather than detrimental to a personâ€™s health. Using the device has several advantages. For one, electronic cigars do not contain tar, carbon monoxide or harmful toxins found in traditional cigars. In this sense, people are can have a healthier way of smoking as they would be inhaling merely vaporized smoke produced by the device.

While traditional cigars obligate smokers to finish their stick to the last puff, E-cigars allow smokers to have a few puffs and turn off the device when not in use. With this, people can be encouraged to smoke less. Smokers can also save more money with E-cigs â€“ which are equivalent to 25 cigarette sticks and whose battery life lasts up to four hours â€“ since they only cost around $2, cheaper than a pack of traditional cigarettes â€“ which usually contains 20 sticks â€“ retailed at almost $6.

E-cigars are also non-flammable since they are reliant on their battery life. Thereâ€™s absolutely no need to carry around lighters, matches or ashtrays. Additionally, the device does not give out smoke, only vapor. The 510 atomizer is the working part of the E-cigar and is responsible for converting smoke to vapor. With only vapor produced, other people are spared from second-hand smoking. Britain allowed the deviceâ€™s use in places where traditional smoking is prohibited.

Also, smokers need not worry about not being able to experience the real smoking sensation one gets from smoking a cigarette since an E-cigar can offer the same feeling. Several versions of E-cigars, particularly the Joye 510 atomizer, look realistic, allowing smokers to get the same satisfaction as from smoking a conventional cigarette.

The device also makes it possible for smokers to smoke anywhere even in areas where traditional smoking is not allowed. Cigar breaks are now possible in airports, air conditioned restaurants or malls since the 510 e cigarette does not give out a strong smell, and does away with the smoke.
