Article published on January 23rd 2012 | Technology

Nowadays, in most offices and residential complexes, visitors often come across video entry systems near the entrance. This type of technology is primarily used to watch and observe the visitors to minimize the chances of intruders getting into the households. It can also be used for opening the doors automatically on getting a nod from the house owner through an electronic signal sent from a control point inside one of the rooms. This latest technology is what we better know as the intercom systems.

The intercom systems are mainly of two types including Wireless and Video systems. The video settings are mainly used to keep a track of what is going around the households without needing to visit the rooms in person. This technology is most commonly used in front of the door bells. The camera is kept outside the entrance above the door while the monitor is kept somewhere within the room as par the wish and preference of the resident.

On the contrary, a wireless setting is used for communicating between the rooms using a set of headphones and speakers. It allows people to speak to someone sitting in any corner of the household without having to roam around and track him down to convey the message. It can also be used in tandem with the video intercom system and placed outside the room to allow the visitors to convey a voice message to the people residing inside the household. Wireless systems are highly convenient and functions as an open platform connected using a bus circuitry. This is not only used in high tech residential complexes but also in applications in commercial sectors.

It is undoubtedly a great way to communicate and most importantly one of the best possible ways of keeping an eye on the visitors and surroundings.
