BES and BIS: 2 Peas in the Blackberry Pod by Kelly Brueggemann

Article published on July 17th 2012 | Technology

You could merely have to remember a pair of details concerning BB: BIS and BES. The BIS and BES share files over a protected link. However, learning the difference between the BES and BIS is an interesting issue, and one worth an explanation.

BES stands for Blackberry Enterprise Server. With it, a Blackberry could access a business internal network. An intranet is specifically made for use by the organization you are working for, implying that it is in-house and unique. Imagine any intranet as a small connection which is cut off from the entirety of the Internet. Naturally, internal networks may get access to the Internet to boot, when specific layers of security are added into it.

BIS means BB Internet Service. It enables the Blackberry to obtain Internet access. Consider the Blackberry Internet Service as the ISP made for your smart phone as opposed to a PC. Unless you are making use of Blackberry Enterprise Server, Blackberry Internet Service is what your smart phone employs to access a site.

As discussed earlier, both BIS and BES grant a Blackberry to use third party software and send email. All the things you perform on your phone run to the BES or BIS system; it's the duty of any BES or BIS to interact with the globe on your behalf. Simply, what distinguishes both the Blackberry Internet Service and BB Enterprise Server is the server operator and the level of security and operation you procure.

With respect to any BES, it is your employer that runs the host. Firms generally place their BES application anywhere inside a corporate system. The Tech Assistance office may manage all the aspects of any system. Nevertheless, Blackberry Enterprise Server licenses would really need to be procured courtesy of the provider.

In the matter of any Blackberry Internet Service, your seller manages the host. All the aspects concerning the BIS are secured; however, thatâ€™s simply all the safety you may have. Your seller may choose the sort of programs to operate in your smart phone; however, you possess the decision about which Blackberry Enterprise Server CALs to buy.

What both the Blackberry Enterprise Server and BB Internet Service share is protection. With a BIS, all the details concerning your phone work in any public connection. Even though information is encrypted, you are still using the World Wide Web; therefore, the probability of someone intercepting your information is much larger. With the BB Enterprise Server, the information can stay on a private network. A thing to take note: make sure you buy Blackberry Enterprise Server (BES) licenses from a quality distributor. Learn more about Blackberry Enterprise Server client access licenses on the discussion boards at this link: blackberryforums.com/bes-admin-corner/114519-bes-cals.html.
