Article published on November 22nd 2011 | Technology

The owner of the CCTV system can perform some of the maintenance, but in most of the cases it is recommended that the owner call up the provider for the maintenance of the system. Because, there are certain maintenance steps that should be performed by the technicians and not by the owner, as it may lead to any problem with the connectivity or other problems with the system.

The basic step in CCTV Maintenance in the CCTV system is to maintain the system in a clean manner. The cameras, monitors, recorder and other components of the system might get dirty, so cleanliness plays an important role in maintaining the system, as dirt might degrade the performance of the system. Especially, the outdoor cameras with a hood get dirty on the lenses with the spider web and other nest built on it. This kind of dirt on the camera lenses will give poor picture clarity during the recording. The performance of the camera also depends upon the environmental condition, although the camera is built to handle the environmental conditions. This might also lead to degradation of the performance of the camera.

Recorders are also supposed to be taken care of. Ensure that the system is working properly with the recording taking place. The recording part should also be taken care of during the maintenance. Clean and check whether the recording is functioning properly or not. The recorders are set up as per the needs of the client; therefore they should be taken care of and should be placed at a secure location as the setting could be important to the user.

The CCTV systems are just like the other systems. There are also conditions where the cameras stop working and the other part of the system such as recorders and monitors stop working. The technicians and the providers would have the idea of which equipment placed at each location. Informing the technician about the problem, the technician would detect and resolve the problem quickly. Experts say that the main problem with most of the security system is that they are not well designed. The main reason behind the problem is that the owner cuts down to a lower CCTV system which stops functioning properly after a period of time. Remember, if you are looking out for the best and good quality security system, you will have to shell out little more to get good service and installation. To cut down the installation charges, most of the users start setting up the CCTV system on their own, leading to failure in the system in a short period of time. So, to ensure that your security system is working in good condition, you will have to do a CCTV maintenance done regularly.
