Article published on December 2nd 2011 | Technology

People will do just about anything to save a buck or two on heating and air conditioning Germantown, MD. Unfortunately, most of those things people do, donâ€™t actually work. Some of them can even cost you money. There are some things you can do to get better performance from your A/C unit and your furnace, but they rarely involve some crazy tricks that people have invented and tend more towards proper maintenance and care. Here are some of the most common myths about heating and cooling your home.

Cranking the Thermostat Gets the Room Cool Quicker

In truth, this doesnâ€™t do anything but overwork your equipment. If you really need to get the room warmer or cooler, and fast, just adjust the thermostat two or three degrees up or down at a time, adjusting it again every time you feel the temperature change. This will allow the temperature to change gradually. Cranking it in one direction or the other wonâ€™t make it change any faster; it will only put undue stress on your machine.

Raising and Lowering the Temperature Take Too Much Energy

When youâ€™re in your car, it takes more gas to speed up than it does to simply maintain a regular speed. This isnâ€™t really the case with an air conditioner. When you are raising or lowering the thermostat, youâ€™re not really burning up significantly more energy than you are when maintaining a comfortable temperature. Some people neglect to adjust their thermostats when they leave the house for fear that moving it up and down to save energy will cost more in the long run. It wonâ€™t. Feel free to save money by adjusting your furnace and A/C up and down when you leave the house.

Heaters and Air Conditioners are Built to Break Down Over Time

Some years ago, a few of the big auto manufacturers got in trouble for engaging in planned obsolescence. This is when a manufacturer goes out of their way to create a product that is guaranteed to break down and need replacing some time down the line. This has happened in various industries from time to time, but itâ€™s not as common a scam as people seem to think. For one, itâ€™s illegal, and for two, itâ€™s bad business. No reputable air conditioner manufacturer is going to make products that are guaranteed not to work as well as their competitorsâ€™ products.

Really, if you make sure to get a regular tune up once a year from Don Hoffacker, you should have no troubles whatsoever in keeping your machine running well into the future. Like a good automobile, an A/C unit or a furnace just needs regular maintenance and care. By swapping out the filter when it gets old, giving it a tune up and not pushing it too hard, you can maintain any air conditioner and any heater for several years into the future. You may not even need to buy a new one until you feel like it, as a good air conditioner really is built to last.
