Experts Predict Win8 Will Be Equipped with Voice Recognition Technology Similar to Siri by Anita

Article published on December 6th 2011 | Technology

Microsoft announced that it would launch beta Kinect in January 2012 based on Windows 8 (hereinafter referred to as â€œWin8â€•) platform, the experts predicted that this system will be the deeply integrated with voice recognition technology.

Microsoft's chief strategy and research officer Craig Munide said to â€œForbesâ€• magazine, Apple's new assistant of voice navigation Siri is not new technology. The time for Microsoft's research and development in the field has been more than a year. Tellme function of Windows Phone 7 allows users to send text messages to another person, and the message is read in the form of voice. There will also be voice search engines.

Munide believed that why Siri is so popular was mainly due to Apple's marketing. And he also admitted that the only place that Microsoft needs to learn from Apple is its marketing strategy.

Given Win8 will be released next year, the expectations of the outside world for the new system integrated with voice recognition technology are increasingly high. Microsoft said they would introduce even more advanced voice recognition system than Siriâ€™s. Recently, Microsoft announced that they would develop Kinect software development kit based on Win8 platform, and beta Win8 platform Kinect will be launched in January 2012. Prior to this time, Microsoft also introduced color and gesture recognition software at the time of selling Kinect.

Experts believe that, due to the necessary technology has been integrated with each other, Microsoft has no reason to apply these functions to the system. The voice recognition technology of Win8 can be very simple, for example, orders can be released after plugging Kinect. The voice recognition technology of Win8 can be very simple, for example, orders can be released after plugging Kinect. And the new voice search function introduced by Xbox interface is dependent on the Kinect.

Win8 system in PC and Tablet PC is expected to show almost a similar experience with Siri, but it needs a supporting Kinect system. Although Microsoft has not announced voice recognition technology of the Windows platform, the third-party vendors are eager to provide this function for Win8 with the help of Kinect Software Development Kit, which will also enhance Win8 market appeal.
