FM Radio Transmitter â€“ a New Trend in Entertainment by Julia Roger

Article published on January 24th 2012 | Technology

FM or â€œFrequency Modulationâ€• has become very popular among the youths of today. A simple portable device that can be easily plugged into a headphone jack or similar port of an audio/video device has brought a revolution in the field of entertainment. The design of an fm radio transmitter is complex electronically but what it does is not very difficult to understand. A radio based communication requires two circuits each at transmitter and receiver terminal tuned to the same operating frequency. The transmitter with the help of an antenna propagates electromagnetic signals. The fm radio transmitter is a revolutionary device of this era as it has given a new dimension to the world of entertainment by modulating the frequency of the radio signals making the sound clear and prominent. These transmitters can easily be installed without any professional help. Driven by battery these transmitters can also be powered using cigarette lighter sockets in your car.

There are lot many makes of FM radio transmitters available in the market for your car but before installing it, you need to ensure that the device is less susceptible to interferences from traffic and buildings. This will improve the signal strength and hence will give you a better audio quality. Secondly, you need to know that lesser the geographical interference between the neighboring stations, better is the signal quality. As FM stations usually have short-range this allows your device to catch the signals in an efficient manner with an increased quality and excellent strength. Moreover, the power radiation from the device should also be less in order to prevent any adverse affects on your health.

So which frequency are you hearing now? Just tune your device to your favorite FM frequency and entertain yourself while you drive back home.
