How AS9100 Certification is Beneficial for Your Company

by Lucas Arnold

Article published on April 16th 2012 | Technology

Manufacturing and production tracking of items is essential for productive business output, regardless of the company or industry. Simple and efficient property and resource identification is a requriement in todayâ€™s competitive business world. It facilitates smooth operation at every step in the production and asset management process, including:

â€¢ identifying products,

â€¢ tracking work procedures,

â€¢ tracking inventory,

â€¢ tracking of shipments.

Implementation of an automated system is chiefly recommended as a means to ensure accurate assets. Studies show that automated data collection as part of a companyâ€™s asset management program can return a 50 % higher return than the actual ERP investment.

The recommended solution for those manufacturers dealing with the aviation, space, and defense industries is currently regulated by the AS9100 standard. In fact, AS9100 certification is mandatory for any suppliers responsible for providing products or services to these organizations. The certification is beneficial to the manufacturer for several reasons, including that a company often receives a boost to reputation and brand quality by holding to such stringent requirements for proper certification. The beneficial prospects of this certification are as follows:

â€¢ In order to be certified, companies must meet minimum standards for company management, resource management, and productivity improvement. Since companies are required to meet the standards and the required management processes outlined in the document, it helps develop the companyâ€™s infrastructure. In addition, necessary management training and skill enhancement programs improve the employeesâ€™ capabilities. The net result is a company made up of employees that are able to perform their jobs with better quality and consistency.

â€¢ The certification also specifies standard quality requirements that must be maintained by the company. In order to stay in compliance, the company is required to perform at a higher quality standard than what might have previously existed.

â€¢ Customer satisfaction is of primary concern under the certification, and a considerable amount of time is spent discussing techniques, programs, and employee training that can improve customer satisfaction levels. The basic objective of any business organization is customer satisfaction, since without customers there can be no company. Obtaining AS9100 certification requires the company employees to be well trained in customer service and well equipped to handle customer demands, as well as have the ability to analyze production quality and to follow maintenance procedures.

â€¢ This certification process ensures that a company has a quality management process and resource protection system. A better knowledge of company resources is required. Also required is proper risk management, which helps a company to improve by reducing financial risks. A recent study by UCLA shows that ISO 9000 standardized companies have significant financial improvements when compared to those companies that arenâ€™t certified.

Blue Dog Tracker is an innovative and unique solution to meeting the challenging standards as specified under AS9100 certification. Take a closer look at this portable device for automated data collection and can learn more about bar coding and AS 9100 certification at www.bluedogtracker.com.
