# How to clean your PC in few minutes by Jakiepan

Article published on February 28th 2012 | Technology

A PC can be slow due to different reasons. Sometime a bunch of factors or causes make your system run slow. Any hardware failure, low memory, any computer infection, corrupt Windows registry and many factors can cause the slow PC problem in your system. However if you eliminate these issues it certainly can be speed up for sure. Some important things are mentioned below.

Are you suffering from a slow PC problem? Do you want to get rid of it? Have you tried too many things and it is still the same? If you are dealing with any of such issue here is the best solution for you. There are few very essential things or points that certainly can be followed in order to speed up your PC.

## Clean your corrupt Windows registry

Windows registry is the main component of any Windows system. If it is corrupt or damaged there are great chances that you might experience the slow PC and other registry problems. All these registry problems affect your system badly and affect the overall Windows performance. So the registry needs to be kept clean and fit all the time.

Editing or repairing the Windows registry is neither often possible nor recommended so you need to use an effective, reliable and efficient registry cleaner program which can clean and repair all the registry problems and make it error free.

## Make your system infection free

Computer virus, spyware, and other malware programs can affect your PC performance to any extent. Virus is one of the most dominating causes of the slow PC problem. If your computer is infected with any kind of virus the speed and performance will be affected for sure.

Run the most updated and latest antivirus, antispyware and other security programs that are effective and efficient and remove all kinds of viruses from your computer.

## Upgrade your RAM

RAM is the main memory for any computer system. It helps to load the program into the memory so that they can run. If the RAM is not sufficient enough it can cause the slow PC or slow performance issue. Upgrade your RAM just double the specified system requirement and see the difference in the speed and performance of your computer system.

## Verify your hardware problems

Hardware parts are the essential of any computer system. You cannot run your machine nicely if they are not working well. If any of the hardware part is not functioning well there are chances that you will experience the performance speed related issues. Replace any such hardware which is not working or damaged with a working piece of hardware and speed up your PC drastically.

## Clean temporary files

Over time due to hundreds of operations many temporary files are created. If you do not remove these temporary files they could be in GBs sometime and slows down the speed and performance

of the system. Remove all such files from the computer and speed up your PC to a good extent.

Run Windows basic utilities

Windows has many useful and miraculous tools and features that are very effective to speed up your PC. Some of the important are Windows Disk cleanup; Windows file checker, Disk defragmentation tool and many more. Run all these useful utilities and they really help to speed up your PC to a great extent.
