Infrastructure Management

According to recent ICT marketing studies of ICT, IT departments spend between 70 and 80 percent% of its budgettheir budgets on operations and maintenance.There is a clear tendency of Many organizations are trying to drastically to reduce this percentage and spend more investment investment towards productive ends, such as in innovation and value creation.

The management and operation of infrastructure is the basis for ensuring the health of business services. The goal of infrastructure management and operations should be , and should focus on getting securing quality and efficient services and predictable costs.

Often, infrastructure management is divided into several fragmented among many groups; is, is reactive rather than proactive; and is, ad-hoc, manual, and not integrated. The result is twofold problems that result are twofold: increased risk and improper functioning of business processes and services may not function properly, and high operating costs.

The usual infrastructure management tools and strategies used are often geared designed onliest a specific technology or area. This narrow approach does not, so do not allow a global view of technology services, and therebydegradinges the efficiency, effectiveness and quality of operations.
