Popularity of applications development in India by [Anoop TU](#)

Article published on April 11th 2012 | [Technology](#)

Mobile applications have gained lot of popularity these days. There are various applications for checking heartbeats, preparing bar exams, guiding with tours and preparing recipes. Business applications such as ERP, BI and CRM are also found. These solutions are used by the business level people and sales people. According the popularity and usage of these applications, iPad and iPhone are first on the list. The market of Android applications development has also entered the competition.

Variety of paid and free apps has been developed by individuals and companies. Expensive iPhone apps are also found and they cost somewhere around \$1000. However, one wonders whether the decision taken by the companies or developers for developing the applications is right or not. There is a variation in the complexities of apps and these ranges from simple calculator app to BI app or ERP which take months for development. However, Smartphone application development India follows the traditional way.

The main focus of the companies is on the development of native apps as they are very easier as compared to others. iPhone application development in India is in Xcode and this is the traditional way of Iphone application development offshore as well. There is also availability of frameworks such as Titanium and Rhodes that help in making the work easier. These frameworks have been developed for the creation of native windows, android, iPad and iPhone applications. They have a single level of coding. These frameworks have many advantages and many a times are available for free. For iPhone application development India, the developer needs to analyze thoroughly the performance and complexity of the application. Even if the functionality of the application is very simple, lot of coding is usually involved. Developers usually make use of SDKs as they contain frameworks for making the process easier.
