Scale Down Fuel Expenses Using NGV Tanks by Julia Roger

Article published on January 18th 2012 | Technology

With rampant use of the natural resources, experts fear that the day is not too far away when Earth would be drained of fossil fuels and would be a part of history.. With the resources slowly depleting with time, the prizes are diesel and petrol is also on a steady hike making it extremely difficult for the car owners to maintain the cars. Therefore, the only solution that can come to the rescue is searching for alternate sources of fuel that is relatively cheaper and most importantly environment friendly. Switching to CNG, better known as compressed natural gas is the perfect solution to this problem.

This switch over can be done easily simply by installing a NGV i.e. natural gas vehicle tank in the automobiles. It is fitted in the back of the seats and directly connected to the engines. It is significantly cheaper compared to LPG. The ngv tanks are specially designed with a much thicker wall as it requires a higher compression. However, its performance is even better compared to other fuels and using them has seen to have increased the overall efficiencies of the car engines and also provided extra mileage which is definitely going to please every single car owner.

Most of the newly launched automobiles, are using this technology in increasing numbers. Even governments of several country is promoting this idea of using alternate fuel sources as evolution of CNG is going to put a lesser pressure on the natural resources which in turn is going to help in preserving the priceless resources for the future generations. At the same time, CNG being safer and cost effective is always going to be better for the environment prospects.
