Article published on March 3rd 2012 | Technology

In recent days, the visitors to a workplace or a residential complex come across an online video entry system at the entrance. This system has been installed to prevent the entry of trespassers or intruders who can hamper in any way, the normal lifestyle of the inhabitants. With the help of these systems, the identity of the visitors can be checked beforehand and they can also be checked out. How do the video intercom systems work? It can open the doors routinely on getting a affirmation from the operator as a result of the digital signal sent from the control stage, which is located inside the rooms.

The video intercom systems are of two types namely the wireless and the video clip techniques. The movie configurations are able to monitor the households without individually visiting the rooms. This infrastructure is placed on the door bells at the entrance. The camera is just kept outside the entrance above the doo while the monitor is generally kept somewhere else, generally a control room. A Wi-Fi set up to be utilized for speaking along with the usage of headphones and speakers. Form any of the rooms you can talk to another person in the other without having to manually move about. The individual can be tracked anywhere he is moving about. Voice messages can also be sent through these devices. The Wi-Fi solutions are very much convenient and can be used as an open-up system linked using a bus circuitry. This system is not only found in residential complexes which use technology, but also is installed in the business areas. It is the best way to keep an eye on the visitors and keep a tab on every movement within the premises.
