Steps of Making a Plug Adapter While on a Tour by [James Blee](#)

Article published on February 7th 2012 | [Technology](#)

Plug adapters are important article whether at home or outside. This small thing has immense use in our daily life but we often forget about its importance. The value of it increases more while we are on a tour. If you forget to take this on your journey, you may face a lot of problems. Thus, you should know the steps of making a plug adapter while travelling. The design is too simple to be tried without any professional help or costly gadgets.

Based on the country you visit, the voltage value of the adapter will change. If you are in England or Norway, the value will be 230volt, the standard voltage used in these two countries. In some other European countries, the value will be 110volt.

First and foremost, before making the plug adapter, you need to be sure about the number of sockets you want to have in your adapter. It may contain a single socket or more than that. Based on this choice, you can buy a solitary or multi-block socket. You will also need a small cable or flex. You can easily reuse an old extension lead, straggling socket or computer type multi-block lead. You must ensure that whatever parts you are using are in a running state. The entire cable or flex that you buy should be inserted socket or multi-block. Then buy a local plug that will fit with your sockets. They will be readily available in any hardware shop or supermarket. The price will vary depending on the country you are in. The plug should be connected with a wire on the other end of the cable or flex. Then your plug adapter is ready which can be used with any electrical item bought from the country..
