The Need to Outsource Software Testing by Harry

Article published on June 6th 2012 | Technology

Any software which is designed needs to be tested thoroughly before the idea can take the shape of a product. The design and the product may fall miserably if it is not thoroughly tested and may be the cause of a lot of troubles. This is the reason a lot of small and big firms opt to outsource software testing.

Before we proceed to enumerate the advantages of outsource software testing, we would first like to explain the concept of testing and the need for outsourcing as this will help you in grasping the concept efficiently.

Software testing is a cumbersome process which needs careful examination of a lot of parameters. There are a lot of different types of testing available which can be broadly categorized into two main heads namely the black box testing and the white box testing. The companies which carry out the testing process should be skilled in carrying out both these testing as both these are complementary forms of testing and are thus integral to the success of your product concept and idea.

Most firms opt to outsource software testing as it helps them in saving a lot of money in the long run. It is not possible for all firms to be conversant in the different areas of testing and this is the reason these firms like to outsource this part of their project to firms who can excel in it. It saves the software developers any botheration to hire testing experts and at the same time, they can be assured that their products would be thoroughly tested because they have hired the finest team in the field.

Hence, now that you are aware of the details of software testing, we will now proceed to other details. When a manufacturing firm decides to outsource software testing, it should wait for the results. As a part of the software testing process, there are a lot of steps that would be executed.

First of all, the software is tested without extensive code examination. In this phase, merely the different errors are traced with help of techniques like equivalence partitioning or boundary value analysis. This is known as the black box testing where the testers may not be aware of the details of the codes used in the making of the software.

The other type of testing which the white box is testing involves rigorous testing of the code and it finds out coding errors and a lot of other problems. The code is subjected to a variety of different tests. We also have unit testing, integration testing and system testing. Yet again, these tests are carried out in detail as they serve to explore the details of the software.

Thus, you must have got a clear idea about the ways in which your decision to outsource software testing can be of help. Testing is a critical step in software making because testing exposes the errors and problems in the software and thus ensures that you can fix the troubles before soiling your reputation by launching erroneous software in the market.
