Tightening Access Privileges through Security Access Control Systems by [Fernando Severns](#)

Article published on June 25th 2012 | [Technology](#)

Whether you are an average homeowner or a business entrepreneur, it pays to have a security system on your lot. A compelling reason to install an effective security system is the rising rate in criminality, specifically property-related crimes. In the U.S. alone, property crime makes up more than three-quarters of all crimes.

The main concern in privacy invasion is not the act of trespassing, but the consequences of an intruder's successful retrieval of sensitive information. In business settings, one cannot restrict access to everyone; nor can one hire too many security guards for every strategic point, as this will only make security processing more tedious and time-consuming (not to mention a source of additional expense). Yes, there must be access to information, but only under predetermined factors, which you will determine.

As such, the most logical solution would be to employ an access control system. This system makes sure that only certain people are allowed to a certain area or system, or that a file can be accessed only within a specified number of times. You can also preset your security by letting certain information or places become available only at specific times and days.

Since there are many companies out there that offer various security control systems, a little inventory and pre-selection research can help you along the way in finding the best deal. Your first step should be to do an access inventory of your company's premises. Determine which areas are vulnerable to unauthorized entry or access, and then figure out the best way to tighten access protection in these exposed areas.

Of course, you need to decide on the level of access controls needed, and what protocols you are comfortable with. There are several technologies currently in use, such as biometric access systems and possessed object access systems. If you want, you can also decide in advance on who will have access and who will be excluded.

To find the most appropriate security access control systems for your company, you can meet and speak with three or four well-established businesses that have been using access control for some time. Their experience with their own security measures can give you a picture of the access system you need.

The last thing you want for your business is for information to bleed out by way of undetected, unauthorized entries. If you think the only way you'll have greater peace of mind is by having an access system, then installing access controls might be the best option for you.
