Article published on January 3rd 2012 | Technology

The stored fuels within the earth surface is decreasing day by day and if we donâ€™t find an alternative to it then after some years we will again need to go back to the carts for transport and all our industries will come to an half. In the urge to find a substitute man has discovered CNG which is a natural gas and a good fuel which can run the vehicles with equal competence as the petrol or diesel. Today you can even convert your oil vehicle to CNG by using the cng conversion kit which is easily available in the market.

There are different types of CNG conversion system available in the market.

1. Bi fuel: This is the most convenient fuel technology that your vehicle can have. This allows your vehicle to operate both by gasoline and natural gas. In this system, you always have a back up. The vehicle will originally run by CNG and when the stock is over it will transfer to gasoline and keep on running. This switching can be even done by the user according to his needs.

2. Only CNG: This is a single fuel technology where the option of gasoline is not there. Your vehicle will be completely converted to a CNG vehicle using the CNG conversion kit. This may be quite effective if you are looking for low cost throughout and do not want the dual options.

The price of the CNG conversion kit is according to the possible options. There are lots of benefits with cng fuel which is not available otherwise. Apart from being a low cost fuel unlike petrol and diesel it is also a fuel that limits air pollution as it itself is a natural gas. So if you have still not shifted, you can surely give it a thought.
