Web Development Company - 7 Stages of Business Development

by Tommy Welgone

Article published on December 1st 2011 | Technology

Hiring a web development company is hard work unless you know what a minimum basic website creation. This is why web development companies can try to fool the high cost of developing your website, if you do not know at least the things that are often involved in the development of a website.

So, here I would like to discuss the main steps involved in the life cycle of web development.

Requirement analysis:

This is the fundamental step to start a web development project and should be done carefully. This is also the first step in any web development company. The analysis can be done through questionnaires, letters, e-mail, participate in interactive sessions, meetings, etc. .. that covers all the details of the selected project (ie the concept).

1. Purpose of website

2. Marketing objectives

3. Who is your audience and what are your expectations?

4. Competitors

5. Database and price details, etc. ..

Preparation of the documentation:

By analyzing all the above factors, it is to estimate if the project is feasible or not? If so, calculate "how much are needed to complete the project?" With these data, a specification document is prepared which gives the customer for verification and approval.

Tip: In this case, the client must also have some basic knowledge about your project. It should compare these data with the market trends and decide whether or not the project?

Note: Some companies usually high rate, as they provide the product quality. Remember that a quality product is always more expensive.

Web Design:

If the details provided are accepted by the client, the web development company in particular will start designing the website. The designs are nothing but the look and feel of the website front-end. In this phase, determine the Web site architecture by developing a detailed map.

Tip: The customer must give their suggestions to make the design more beautiful. Also check that the design is not used by another person.

Web Site Development and Coding:

This is a very important phase in any web development company. This is the current coding and database design. Communication with the database will be treated in this phase of development and code writing background. This accumulation is given to test engineers to check for errors that occur.

Testing:

Engineers test a test cases to the backlog of work correctly or not? The defects intimated to rectify developers. This cycle continues until minimal or no errors were found. Construction without mistakes then you will be given to the client for approval.

Deployment:

If the customer accepts the building, then the website has been implemented to make it go live.

Tip: Choose the best web hosting company, ensuring full security and customer service.

Maintenance and update:

This is the final stage of the lifecycle of web development that involves updating and maintaining the website with the latest features that are useful to users.

This, said the life cycle is not fixed and may vary according to the web development company you choose.
