Article published on June 1st 2012 | Technology

Luckily, with just a little studying, you will be able to select the best data center provider for you and your business.

You should consider the services that the data center providers you are considering are offering. Do they offer just a physical location for servers, or are they a full-service colocation data center that offers more specialized services like managed cloud hosting or a virtual private cloud service that they will customize for your business and its needs? Don't just choose a data center provider because that provider offers a number of services, but choose the provider that offers the best solutions for your business. For example, do you need private cloud solutions or managed hosting? If you don't, you won't need to worry about these services.

Secondly, support and security are crucial elements when choosing a data center provider. You need to look into the level of support provided and whether or not there is a fee for that support. Will the data center offer you support at all hours of the day and night? What options are available for backup? For security? List these options, and remember that you want the most security and support possible for reasonable prices.

Although it can take time to learn about these components, you need to do so to make an informed decision. You can visit www.gnax.net to learn more about data center options.

Choosing among data centers can be challenging. But knowing what options and services you need, like virtual private cloud can help.

About GNAX With over 10 years as an industry leader in the southeast, Global Net Access (GNAX) operates two world-class data centers, AtlantaNAP and DallasNAP, offering mission-critical data center colocation and cloud services. GNAX provides superior technology solutions to a variety of organizations and industries worldwide. Privately held with headquarters in Atlanta, GA, GNAX was founded in 1999 and has retained net income profitability since 2003.
