Tips for buying the best home theater for your home by David Raju

Article published on August 24th 2012 | Theater

The market is crowded with various electronics brands that guarantee you best home theater system at cheapest price. Here the choices are many, thatâ€™s why to purchase best home theater system one should keep little patience. One should also check the advices, suggestions and past experiences of near and dear ones to select best home theater system.

1. Brand:

Many times itâ€™s said that the brand isnâ€™t everything. But having a branded home theater system will give you much piece of mind. Best Home theater system delivered by various branded organizations such as LG, Sony, Samsung etc. are although costlier. But their products are better in terms of quality and give you complete customer satisfaction and prove to be best value for your money.

2. Check online reviews:

Before selecting any home theater system check its features and performance in its website. Check the user reviews available in various online electronics forums. Compare the things between each product and each review of users in website. Due to this you gain knowledge about price and feature difference and also warranty given to those products.

3. Features:

First find out the main need behind having a home theater system. If you are not a very avid movie viewer and the home theater system need is to just watch general television shows and serials then there is no need of purchasing feature rich and technically advanced home theater system. Look out for any home theater system with basic features. But if you want the home theater system for watching DVDâ€™s and Blu-rayâ€™s then itâ€™s best to purchase any home theater system with all kind technically advanced features such as 3d viewing, Dolby Digital surround sound etc.

4. Size:

Check the size of the room where you are going to install your home theater system. If the size of the room is small than a normal sized television and a basic home theater system will be more than enough. But if the size of the room is spacious then you will need bigger TV for best viewing experience.

5. Player

A home theater can do a remarkable job of mimicking the multiplex experience. DVD players and newer televisions can produce detailed high-resolution pictures, offering realistic portrayals of everything from the largest explosion to the smallest teardrop. And you can see the difference, as the higher resolution produces a noticeably smoother and clearer picture.

6. Speakers

While the visual element is at the forefront of a movie's appeal, sound is what really immerses you in the experience. To achieve theater-quality audio, you'll need more than the speakers built into your TV or the two bookshelf speakers that came with your mini stereo system. Most home theater

systems also include an A/V receiver--a box that acts as the hub for all audio input from the various components of Home theater systems, decodes surround-sound signals, and amplifies and balances sound before sending it to the speakers.

7. Screen

While you can watch DVD movies on any television, wide-screen TVs work especially well because most DVD movies use the wide-screen format. Flat-panel TVs are just a few inches thick and can be either wall- or stand-mounted. LCD panels are available in sizes ranging from portable units of a few inches diagonal to wide-screen models. Plasma panels start at different models. Rear-projection TVs cast a video image onto the inside of a translucent screen by means of internal mirrors and lenses. All rear-projection TVs available today are wide-screen HDTV designs. Originally developed primarily for business presentations on computers, compact front projectors have become increasingly popular for home theater.
