Car windshields are designed to be sturdy, but occasionally the glass becomes damaged and needs to be repaired. More serious cracks may require that the whole windshield is replaced, but for smaller chips and scratches you can have your windshield repaired as good as new - as long as care is taken to ensure the job is handled correctly, and to a suitable standard.

Repairing your own windshield could save you money, but this is only advised if you have the necessary experience and skill. There are various common problems associated with inadequate windshield repair, which can leave the rest of the window vulnerable to further damage or can obstruct the driver's view of the road, especially if the damage is on the driver's side of the vehicle. You should also consider the resale value of your car in the future, which could be significantly impaired by performing DIY repairs rather than taking your car to a professional repair shop to be looked over.

Auto glass technicians are skilled at repairing many types of glass damage, from minor chips to scratches, and will be able to inform you if the windshield needs replacing. As well as benefiting from a professional job, you can also look forward to fast service when having windshield chips filled in with resins and chemicals, and you'll usually be able to drive away in no time with a windshield that's good as new, and that's been repaired in line with your manufacturer's guidelines.

When it comes to windshield repair, you need to consider more than just the immediate repair work and think about the long term. Performing your own repairs at home using a windshield repair kit could affect the structure of the windshield, which is a vital part of the overall structure of your car. Arranging professional car glass repair as soon as you notice signs of damage will reduce the risk of this damage worsening and putting you and your passengers in danger.

It's not always possible to avoid windshield damage occurring in the first place, but you could lower the risk by avoiding driving on uneven or country roads, and by ensuring your vehicle has a suitable warm up period before driving on cold days, when the glass may be more vulnerable to extremes in temperature. Parking your car in a garage or parking lot will also lower the risk of windshield damage occurring.
