Building Your Own Amp Flight Case by Julia Roger

Article published on June 14th 2012 | Travel Tips

It is a well known fact that good quality and ready-made amp flight cases are quite expensive and everyone can not afford them. This is one of the major reasons that most of the people have now started building their own amp flight cases which can bring down your cost to roughly half the market price. Apart from the cost factor, building your own amp flight case also gives you the freedom to decide the required dimensions and any extras to be added. However, this is not as easy as it sounds and does require some expert advice.

Before you start building an amp flight case, you should locate a vendor who can provide you with steel parts and aluminum flight case extrusions. However, you may even be required to use some parts which are made on special order and not readily available in retail. The thing worth noting is that one should not compromise on the quality of parts just to save a little amount of money. This is because an amp flight case which is entirely constructed out of standard parts is indestructible because of a proven, interlocked system that is formed. Even if one of the components of this system is left out, the amp flight case loses its sturdiness.

In addition to the flight case parts, you are also required to get hold of all the appropriate tools which will help you in building that perfect flight case. Some of the important tools which you will require to build your own amp flight case are electric drill, a jigsaw or hack saw, a special tool like pop rivet wrench, steel drill bit, etc. Most of your efforts will be expended in getting hold of the parts and extrusions. But once you have everything in place, the rest will require minimal skills.
