Article published on March 27th 2012 | Vacations

You rely on your favorite car to commute at all times. If you are far from home and your car will not start, you may be in serious trouble and sometimes, you may stuck for a long time while waiting for assistance. Auto parts may fail at the most inconvenient time, but if you care for your car, you should be able to understand the symptoms given by your vehicle and detect a problem before it turns into a breakdown. Problem with starting are most often because of failing batteries or faulty starters.

Diagnosing the Problem

You don't have to be a know-it-all car technician to diagnose simple car troubles. You can't always repair all faults on your own, but knowing more about the auto parts will help you to recognize a failing component before it leaves you stranded. If you notice that your starter motor is becoming noisier with each engine start, then it may be time for the starter to be serviced, or replaced. If you can hear the starter turning but the engine is not turning, then the bendix drive could be failing and you will need to urgently attend to the problem. If the starter just make a single click sound when you turn the key, then the solenoid could be failing or the brushes could be completely worn down. Sometimes you can get the starter to work again for a short while by tapping it on the solenoid or on the body of the starter. This may help you get the car going again but it is not a permanent fix and the starter should be serviced or replacement as soon as possible.

Bad alternators can also prevent the car from starting by causing the battery to run down. A failing alternator should cause the red battery light on your carâ€™s dashboard to illuminate but this will not happen in all cases. Sometimes when voltage regulators fail, the voltage output from the alternator will drop. This will cause the battery to run down and the car will struggle to start.

Dealing With Repair or Replacement

Car owners know that car troubles often turn out to be expensive. If you put up with symptoms of car trouble for fear of having to spend money, then you might end up burning a big hole in your wallet later. Your car should not let you down on the roads and so, listening to its signs of trouble will save you a lot of hassle. With problems related to starters, you may think about repair or replacement, but it is often best for a trained mechanic to first diagnose the fault so that you do not replace parts unnecessarily.

You can save money by purchasing replacement car alternators online and to do so, you should know the make and model of your car along with its engine size. Reputable online sellers will sell you genuine auto parts with manufacturer warranty. It is better to buy quality replacement products for your cars if you want to ensure reliable service. You can also shop online for replacement parts to repair starters and alternators like regulators, rectifiers, brushes, diodes, sliprings, solenoids, bendix drives and repair kits.
