Do Cell Phone VoIP Save you Big Money?

by John Peterson

Article published on June 20th 2012 | VOIP

It used to be that anyone who wanted to put a long distance phone calls for your family or friends had to sign a contract with the long-distance telephone company. This service allows us to provide long distance, but often it is very much a minute costs, making long distance calls an expensive proposition. It was a big relief, because the advent of mobile phone service has brought great change.

Cell phone plans gave us access to a certain number of minutes of calls at a fixed price plus, usually free in the evenings and long weekends. Of course, they also have disadvantages, such as sometimes spotty service areas, dropped calls and too often, bad reception. Now, VoIP brings us another option for long-distance service, promising greater comfort and freedom. We can even consider the possibility of connecting mobile phones and VoIP technology. Have these promises been fulfilled?

There are three types of VoIP service is usually offered: computer-to-PC, IP phone and ATA. These services are offered through your computer at home. Simplest, perhaps, is an ATA (analog telephone adapter) mode, which lets you use your home phone. You You can simply connect the phone to the PC and the VoIP service converts analog sound into digital data and vice versa. IP (Internet Protocol) service uses specially designed phones. These phones look a regular telephone, but it is set up internal VoIP compatible. IP phones can be wireless, giving you the freedom to move through your home or office, as you say convenience.

The most unusual option is computer-to-PC VoIP. For this your provider will give you a special software to install on your computer. Long distance calls are placed directly from your computer. Instead of a telephone handset, you can use a microphone connected to a computer to speak. All these services can be useful and convenient, but none offer a total mobile phone transfer. Now, VoIP phones, the concept leads to some excitement, offering low-cost long distance and portability features an attractive combination.

Many people are turning to VoIP as available savings. Normal VOIP service offers a great combination of features such as Caller ID, Call Waiting, 3-way calling, free local calls and very low-cost international calls. All this is usually required to pay $ 19.95 from $ 34.95. An additional fee, of course, your ISP, which probably is about $ 40 each month for broadband access. Even ISP and VOIP together is still may be cheaper, but as with the traditional phone company. This can not be true, but if you also change your cell phone VOIP.

VoIP cell phone plans usually have both a minute and a monthly fee. Someone who is currently assigned to use all their minute plan, they probably will not realize any savings go to VOIP cell phone service. And if your Internet connection is frequently interrupted, you will also experience the dropped calls that can sometimes plague traditional cell phones. However, someone with a reliable Internet service, which often make international calls from your cell phone or exceeds their traditional plan minutes, VOIP cell phone service can be a great alternative.
