Article published on May 8th 2012 | VOIP

As everyone knows that the VoIP â€“ â€œVoice over Internet Protocol â€œis a new technology that has overtaken the traditional telephone and mobile phone company. The popularity of this VoIP technology is growing day by day, such as increased network coverage area. Through VoIP technology, one can make or receive calls using your internet connection.

VoIP service is basically a switch junction that handles all telephone incoming calls or outgoing calls through the IP network where all communication between users is done in the form of data packets. This streamlines internal telephony networks is to facilitate business. That's why professional users can share a lot of lines connect to their external customers worldwide.

VoIP PBX phone is basically a private branch exchange, kept specifically for professional firms where a lot of calls should do regarding the job. This VoIP PBX is very popular with commercial enterprises and also very useful to them. Corporate Empires can utilize these VoIP systems to connect the internal phones outside the line. Therefore, this entire phone service let you communicate both ways â€“ data communication and voice communication in a single system. As a result, it becomes profitable and easy call handling with great functionality.

In general, the VoIP phone is a high-technology that is used to pass the calls without any hindrance. The voice call quality is same in-between VoIP phone users or between two traditional phone users. Overall it works the same as a normal phone call.

A VoIP internet phone is a computerized system to manage calls. It consists of a set of external telephone lines as well as the issued internal phone number, one or two SIP phones, VoIP server and a VoIP gateway that connects with existing telephone lines. Different phone numbers have been assigned to each person and these numbers of internal lines are often represented as internal numbers and these numbers generally consists of 3-4 digits.

In addition, VoIP phone systems have several advanced features that are very useful for business users. Some of the features are called the Conference attendants, call waiting, caller ID, call transfer, Call Forward, Caller ID Display, intercom, Password protection, night service, Voice Mail and many others.

Following are some special benefits of VoIP internet phone service for business users:

1.) Actual Cost - This service is very profitable. It saves the cost of communication within the work area or internal communication or communication within the various departments. This is also able to make long-distant calls, at amazing low rates.

2.) Wireless Technology - This service depends on the server computer and you do not need to connect your phone with wires. This is a wireless technology. You can even use this service anywhere in the world and the main thing that need is to get the internet connection and the VoIP service ID and password.

3.) Easy to handle - VoIP Telephony service is quite very easy to manage. This service is fully automated and also easily manageable by a single computer system.

4.) Flexibility - This service provides the flexibility to send voice data and text data to any location in the world. So, both communications are possible.

5.) Voice Quality - This service provides good voice quality without any hindrance.

Most companies are migrating to this internet telephone service for their internal as well as external communication. These advanced benefits are also the main attraction of this service.
