Article published on January 19th 2012 | Web Design

Drupal is one of the best content management systems in the area of web development. Like the other leading web content management systems Drupal also separates contents from the presentation through the templates like, php, xHtml or css. The Drupal is much more user friendly that the other available Cms or content management systems. This has attributed to the increasing demands of PSD to Drupal conversion. The PSD to Drupal theme conversion is a way of creating dynamic websites. The open source nature of the Drupal has also attributed in increasing the number of people willing to convert PSD to Drupal.

If you are opting for converting the PSD to HTML/Drupal there are certain basic rules or guidelines to be followed to get the maximum out of your website. The PSD to Drupal theme conversion needs to be precise and moderated effectively to provide with high end and highly scalable website. The website framework should be simple so that it could be managed via a web based interface. The website should also be good to deal with security issues.

Tips for PSD to Drupal conversion

1. W3C Validation:

W3C has given some basic rules/principles, which should be followed to make you website more efficient. While you are converting from PSD to CSS/Drupal you will need to keep in mind that the website is W3C validated and efficient. This helps in enhancing the performance of your website at the same time it ensures that your website is synchronized with the latest technological updates.

2. Flawless coding:

While you are converting PSD into Drupal, the most important step is the conversion of the PSD file into HTML/xHTML web compatible format. It would be preferable to hand code all the slices rather than auto generating them. In many cases the codes may have serious errors, which re not easier to debug. It would be wiser to use simple coding technique to define all the elements of the website and their performance in search engines.

3. Use of CSS files:

The uniformity in the website can be achieved by developing CSS files for all your pages and sections. This ensures that the forms, fonts, font sizes and colour are uniform throughout the website. This helps in distinguishing between the design and the content and it helps you in publishing the content without interfering with your design. It also allows you to create changes to all the pages just by changing css file.

4. Cross browser compatibility:

When you convert PSD to Drupal you need to make sure that the website is working fine with the different browsers. As the visitors to your websites will be accessing it via different browsers and OS, so itâ€™s very important that your website should work fine with different browsers. A non-compatible website will earn you a bad name and you will lose most of your traffic also.

These simple looking tips can give you an upper edge over your rivals. It would be better if you could hire services of a professional for the conversion. Look out and select the web developer that

suits your need.
