Why to Convert PSD to HTML Email Know the Reasons by Justin Spencser

Article published on January 18th 2012 | Web Design

The importance of an email in business communication needs no introduction. But how much impact does your email make to your clients? Does it grab their attention at the first glimpse? One of the ways of making sure your emails make impact is to custom design them. You can do it with PSD to HTML email conversion. This is how those personalized emails land up in your mailbox. A PSD to HTML template is made by designing the emails as an image in Photoshop and then coding it with the HTML mark-up. These emails can be easily integrated into popular email servers such as Gmail, Yahoo Mail and Hotmail etc. There are a lot of reasons to convert PSD to Email and some of them are -

1. The emails can be highly personalized for each recipient such as â€˜Dear Mr John Smithâ€™. This makes the targeted customers feel important to your business which would add to your brand value and sales. This is much better than addressing an email as â€˜Hi Allâ€™, â€˜Dear Customerâ€™ or â€˜De which are often deleted by the recipients.

2. This conversion technique will allow you to customize every aspect of your email. From the logo to the footer and the colour scheme you can have it all the way you want. You can make use of graphics and Flash elements in your mail to make it look attractive.

3. A PSD to CSS/HTML email allows you to create interactive messages which have a high â€˜call-to-actionâ€™ factor and help in attracting customers to your website and can help in increasing your sales directly (in case you have an ecommerce module) or indirectly. The emails can also be coded to automatically open the browser and connect to the webpage.

4. If you are contemplating an email marketing campaign to market your products and services PSD to HTML email is a must for you. This allows you to integrate these emails into email marketing software to draw maximum advantage out of the campaign.

5. When you convert PSD design to HTML/email you can include tracking scripts or invisible visitor counters using HTML. This enables you to receive reports on message viewed or click by the recipients. This gives you real time data on the success of your email campaign.

6. PSD to Email conversion allows you to include dynamic elements such as instant survey forms, unsubscribe requests, subscripting requests, payment links, sponsorships, forwarding requests etc. in the body of the mail. This helps in promoting your business and automates a lot of things which used to be done manually earlier.

To create a PSD to Email template needs both creativity and technical knowledge on part of the developer and thus you should hire the services of a web development company which has prior experience in this niche of HTML conversion. There are a few companies around the world who specialize in this service and teaming up with them would help you draw maximum mileage out of your business emails.
