Working Flow of a good Web Design Company by David Raju

Article published on July 21st 2012 | Web Design

The web development workflow is a guide intended to educate you on the stages of web development, from planning through to deployment. The following are the some work flow steps for the web designers.

1. Planning and Software Setup:

Planning your objectives is crucial to obtaining the results you desire in the end. In this step you must and should take the necessary objects and tools which are required for designing a web site. Setting up the software needed to build your website will save you time once you begin development. Also setup the database for store the information. Web Design Company must have planning about their design and web assistance those are need for them.

2. Business setup:

Once you are familiar with the tools you will be using to create your website, you are able to establish a timeline for the remainder of the project. You will save time if you also register your domain, set up your commerce needs and research legal requirements in this stage. In this first register your domain name. Install the SSL certificate, Purchase and set up your hosting account, create the bank account and Set up your payment gateway. Finally research the legal requirements for your web design.

3. Design and Production:

Creating compositions for your website allows you (or a client) to get a feel for how the website will look and how a user will navigate it. After comps are complete, you can optimize and slice your graphics, as well as create your html and css. Alternatively, you can purchase web templates, which will quickly accomplish many of the steps in this stage. In this step you have to do create wireframes and compositions, Slice and optimize your graphics, Produce your template with HTML and CSS, Create specialized style sheets and navigation, Validate your HTML and CSS, Add meta-tags and apply SEO techniques, Add share buttons and social media features and etc.

4. Development:

Now you can add forms, maps, products, a shopping cart, checkout pages and anything else you want to achieve with your website. In this Establish a database connection, Create bindings and repeat regions, Create emails from your website, Create catalog pages, create site maps and etc.

5. QA and Deployment:

In Website Design it is important to test your website before you deploy it. Quality assurance typically includes: testing for broken links, browser compatibility testing, proofreading, performance testing, security testing, transaction testing, functional testing on dynamic pages and usability testing. Finally, you can deploy your website to the live server - your hosting account - and allow the world to visit your website

Through trial and error, we have created a successful workflow that will save you time and money. Not all steps in the workflow will be applicable to your website. As you begin the Planning Stage, review all the steps and decide which apply to your site?
