Liposuction with Fat Transfer for an Enhanced Body Contour by Sarah Kathey

Article published on April 23rd 2012 | Weight Loss

Liposuction is one of the most commonly performed plastic surgery procedures in the United States as advanced technology has made it reliable and safe, and very effective. One of the greatest advantages is that liposuction can be combined with fat transfer to enhance body contour. Excess fat aspirated during liposuction surgery is used to improve the appearance of the areas that need more volume, such as the breasts, buttocks or face.

How Liposuction with Fat Transfer Works

If you have decided to improve the shape of your body with liposuction and fat transfer, your first concern should be to locate an experienced plastic surgeon. Do some research and choose a surgeon experienced in the latest liposuction techniques like SmartLipo TriplexTM.

Suppose the area from which you want excess fat to be removed is your abdomen. Your surgeon will administer local anesthesia and use the advanced SmartLipo modality which features a triple-laser enabled cannula to melt and remove your excess tummy fat easily and safely. The fat that is siphoned off is then carefully processed and re-injected or grafted in the area where you would like more volume, for example, your breasts, buttocks, or face.

One of the greatest advantages of this fat grafting procedure is that it utilizes your own fat to increase the volume of fat in your selected area of the body. This reduces the chances of rejection by your body. Moreover, the transferred fat is absorbed by the body within a few months.

Autologous breast augmentation with fat transfer is widely popular as an effective cosmetic procedure as well as a reliable technique to increase and correct contour in reconstructed breasts. Besides the breasts, fat injections can improve the volume and shape of the buttocks and also add fullness to the cheeks and lips.

Many Advantages

Liposuction fat transfer offers many advantages:

â€¢ You lose stubborn fat via liposuction and gain volume where you want via fat transfer

â€¢ The adipose-derived stem and regenerative cells (ADRC) extracted during liposuction can be preserved for your own use later

â€¢ It is safer and less expensive to use your own fat than dermal fillers

â€¢ If done for the breasts, avoids the complications associated with breast implants

â€¢ Your body will not reject the fat

â€¢ Natural-looking and long-lasting results are ensured as the transferred fat takes on the feel of the tissue in the area where it is implanted

Ensuring the Best Results

While liposuction fat transfer for an enhanced body contour offers an excellent aesthetic outcome,

you can ensure the best results only if you put yourself in the right hands. The plastic surgeon you choose should be trained and experienced in the procedure, and perform the procedure in an AAAASF-accredited plastic surgery facility. Once you are evaluated as a suitable candidate, make sure you ask your physician to tell you about the potential risks and complications in advance. In the hands of the right surgeon, liposuction treatment and fat transfer would provide the outcome you are looking for.
